SUPPLEMENTARY DISCLOSURE STATEMENT

Mail Stop Amendment  
Commissioner for Patents  
P. O. Box 1450  
Alexandria, VA 22313-1450

Sir:

Examiner's attention is directed to the  
following patents:

03/01/2006 BABRAHA1 00000034 10566831

01 FC:1806

180.00 OP

U.S. Patent 6,468,489 to Chang et al discloses apparatus that comprises a NO<sub>x</sub> reducing unit, a duct to receive a flue gas stream from said NO<sub>x</sub> and reducing unit, and an activation source associated with the duct.

U.S. Patent 6,267,940 to Chang et al discloses a method of reducing NO<sub>x</sub> within a gas stream and includes the step of placing a NO<sub>x</sub> reducing catalyst within a flue gas stream. The NO<sub>x</sub> reducing catalyst activity is enhanced by applying a separate activating source that significantly improves removal of NO<sub>x</sub> from the flue gas stream.

U.S. Patent 6,153,159 to Engeler et al discloses thermal catalysts, particularly catalysts coated with precious metals, used to reduce the concentration of CO, HC and NO<sub>x</sub> in exhaust gases from internal-combustion engines.

U.S. Patent 6,346,419 to Ryerson et al discloses an efficient, lightweight, and relatively inexpensive photolysis system based on use of a short-arc Hg arc lamp that provides a simple and accurate method for measurement of ambient NO<sub>2</sub>.

U.S. Patent 6,475,350 to Palekar et al discloses an apparatus and a method for removing pollutants from gas streams using a reactor assembly. The reactor assembly includes an inlet, an outlet, at least two electrodes, a catalyst bed, and plasma generated from the electrodes. Electrical energy is applied, and catalytic surfaces enhanced by the plasma results in the reduction of  $\text{NO}_x$  to  $\text{N}_2$  and oxidation of particulates and hydrocarbons to  $\text{CO}_2$ .

U.S. Patent 6,038,854 to Penetrante et al discloses a non-catalytic two-stage process for removal of  $\text{NO}_x$  and particulates from engine exhaust and comprises a first stage that plasma converts NO to  $\text{NO}_2$  in the presence of  $\text{O}_2$  and hydrocarbons, and a second stage, which preferably occurs simultaneously with the first stage, that converts  $\text{NO}_2$  and carbon soot particles to respective environmentally benign gases that include  $\text{N}_2$  and  $\text{CO}_2$ .

U.S. Patent 5,711,147 to Vogtlin et al discloses a non-thermal plasma gas treatment combined with selective catalytic reduction to enhance  $\text{NO}_x$  reduction in oxygen-rich vehicle engine exhausts.

U.S. Patent 6,395,238 to Rogers et al discloses an improved non-thermal plasma treatment method and apparatus for the pretreatment of nitric oxide-bearing exhaust gas with ethanol, either by vapor absorption or direct vapor injection.

U.S. Patent 6,139,694 to Rogers et al discloses an improved non-thermal plasma treatment method and apparatus that provides for the pretreatment of nitric oxide-bearing exhaust gas with ethanol, either by vapor absorption or direct vapor injection.

U.S. Patent 6,365,112 to Babko-Malyi et al discloses removal of certain contaminants from a stream of contaminant-laden commercial and industrial exhaust gases conducted through an electrostatic precipitator by passing a reagent fluid through corona discharge active zones to activate the reagent fluid as the reagent fluid is injected into the stream such that the activated reagent fluid reacts with the contaminant to be removed.

U.S. Patent 6,345,497 to Penetrante discloses a deactivated atomic nitrogen generated by an electron beam from a gas stream containing more than 99% N<sub>2</sub>, injected at low temperatures into an engine exhaust to reduce NO<sub>x</sub> emissions.

U.S. Patent 6,030,506 to Bittenson et al discloses a method and apparatus for delivery of exogenous non-thermal plasma activated species to a subject fluid comprising (a) creating activated species in an energizing means; and, (b) introducing said activated species into a subject fluid by high speed injection means.

U.S. Patent 6,176,078 to Balko et al discloses a highly reactive reducing gas mixture produced from vehicle fuel and introduced into the exhaust gas of an internal combustion engine operated at lean burn conditions and passed over a reducing catalyst to convert  $\text{NO}_x$  emissions to benign emissions.

U.S. Patent 6,117,403 to Alix et al discloses a process and apparatus for reducing particulate, nitrogen oxides (" $\text{NO}_x$ "), sulfur dioxide (" $\text{SO}_2$ "), and mercury (" $\text{Hg}$ ") emissions from the combustion exhaust of fossil fuel fired plants while producing an end product that is commercially useful.

U.S. Patent 6,773,555 to Izutsu et al discloses a flue gas treatment method and apparatus for removing sulfur oxides.

U.S. Patent 6,027,616 to Babko-Malyi discloses a method of treating industrial gases to remove contaminants.

U.S. Patent 5,154,807 to Harvey discloses a method and electrolytic catalytic cell that chemically modifies the structure of hydrocarbon fuels in which the cell is immersed, by electrochemical series potential, electrolytic cell and catalytic action of preferably a noble metal cathode and zinc anodic elements movably continually contacting and circulating the fuel, giving rise to evenness in ignition and completion of combustion with elimination of noxious by-products largely by combination with the hydroxyl ions formed by the catalytic action.

U.S. Patent 5,807,491 to Materi discloses a process and apparatus for treating an organically contaminated inorganic liquid or gas with an electron beam. The organically contaminated inorganic liquid or gas is introduced into a reaction chamber that is positioned so that the organically contaminated inorganic liquid or gas will be exposed to the electron beam.

U.S. Patent 6,811,759 to Tsuchiya et al discloses a method for producing an iron oxide pellet including the steps of adding water to a raw material mixture comprising iron oxide which serves as a primary component, a carbonaceous material in an amount sufficient for reducing the iron oxide, an organic binder in an amount sufficient for binding the iron oxide and the carbonaceous material, and an inorganic coagulant in an amount of not less than 0.05 mass % and less than 1 mass %.

U.S. Patent 6,605,263 to Alix et al discloses a process and apparatus for removing SO<sub>2</sub> from a gas stream having the steps of scrubbing the SO<sub>2</sub> with an ammonia scrubbing solution and removing any aerosols generated by the scrubbing in a wet electrostatic precipitator.

U.S. Patent 6,676,912 to Cooper et al discloses a method for removing NO<sub>x</sub> from gas streams emanating from stationary combustion sources and manufacturing plants and utilizes the injection of hydrogen peroxide into the gas stream for rapid gas-phase oxidation of NO to NO<sub>2</sub> and water-soluble nitrogen acids HNO<sub>2</sub> and HNO<sub>3</sub>.

U.S. Patent 6,651,637 to Oakes discloses a system for monitoring the backpressure produced by a particulate filter on an internal combustion engine.

U.S. Patent 6,523,277 to Claggett discloses an apparatus for drying and stacking treated workpieces and includes a housing defining a drying chamber.

U.S. Patent 6,743,404 to Schumacher et al discloses a reactor for the catalytic oxidation of ammonia to form nitrogen oxides which has a noble metal gauze catalyst and a heat exchanger in that order in the direction of flow.

U.S. Patent 6,612,249 to Sanders discloses a method for reducing NO<sub>x</sub> and/or CO/CO<sub>2</sub> emissions from the combustion of coal products or hydrocarbons. One or more curtains of particulate elemental iron, in the form of flakes or the like, are fanned across the combustion chamber and/or the exiting flue gas stream while it is still at high temperature.

U.S. Patent 6,488,740 to Patel et al discloses an apparatus including a wet electrostatic precipitator (ESP) field disposed along a combusted fossil-fuel flue gas stream path downstream of a dry ESP field.

U.S. Patent 6,264,899 to Caren et al discloses a method and apparatus provided for reducing pollutants in the exhaust gases produced from the combustion of a fuel by introducing hydroxyl and associated radicals and oxidizers into at least one of the precombustion and postcombustion gas stream of the combustion engine upstream of the catalytic converter and treating the exhaust gases with the catalytic converter.

U.S. Patent 5,843,210 to Paranjpe et al discloses an electrostatic spray apparatus including an electrode for generating a high-voltage corona, one or more sprayers for generating a spray of liquid droplets and for directing the droplets into the high-voltage corona whereby an electrical charge is imparted to the droplets.

U.S. Patent 6,506,351 to Jain et al discloses a process for removing nitrogen oxides from gas streams such as furnace or utility boiler flue gas streams.

U.S. Patent 6,503,469 to Izumi et al discloses a polluted fluid, such as exhaust gas from a refuse incinerator, containing at least one pollutant, such as volatile organic compounds (VOCs),  $SO_x$  or  $NO_x$ , that is processed by passing the polluted fluid through an adsorbing layer containing a high-silica adsorbent capable of adsorbing both ozone and at least one pollutant to adsorb at least one pollutant on the adsorbent.

U.S. Patent 6,066,590 to Horii et al discloses a harmful gas removing agent used for removing harmful gas such as CO, NO<sub>x</sub>, and O<sub>3</sub>, from exhaust gases ventilated from automobile tunnels and underground parking, thereby preventing air pollution.

U.S. Patent 6,742,326 to Xu et al discloses a system and method for providing operating conditions that provide higher efficiency NO<sub>x</sub> reduction in a lean NO<sub>x</sub> catalyst coupled to a lean-burning internal combustion engine.

U.S. Patent 5,524,432 to Hansel discloses nitrogen oxides are removal from the exhaust of an internal combustion engine which operates on a methane-containing fuel by reacting the nitrogen oxides and oxygen in the exhaust gas with a controlled amount of methane in the presence of a reducing catalyst.

U.S. Patent 5,336,476 to Kintaichi et al discloses a process for reducing nitrogen oxides to nitrogen from exhaust gases, which involves bringing exhaust gas containing nitrogen oxides into contact with at least one catalyst from proton-type Zeolites.

U.S. Patent 6,725,643 to Paul discloses a gas turbine power generator with ultra high efficiency, the generator being an assembly of electric motor-generator machines and turbine configurations used in combination with combustor systems for operation of select integrated turbine configurations.

U.S. Patent 6,682,709 to Sudduth et al discloses gas-phase methods and systems for reducing NO<sub>x</sub> emissions and other contaminants in exhaust gases, and industrial processes using the same.

U.S. Patent 6,224,839 to Fan et al discloses economical NO<sub>x</sub> reduction from flue gas that is essential for the long-term profitability and existence of fossil fuel based thermal power plants.

U.S. Patent 5,744,112 to Irite et al discloses a method of cleaning an exhaust gas using an exhaust gas cleaner constituted by a first catalyst comprising a first porous inorganic oxide supporting an Ag component, a W component and a Pt component and optionally a second catalyst comprising a second porous inorganic oxide supporting a Pt component alone or in combination with a W component.

U.S. Patent 5,670,444 to Yoshida et al discloses a process in which nitrogen oxides are efficiently removed from an exhaust gas containing nitrogen oxides and an excess amount of oxygen.

U.S. Patent 6,287,111 to Gensler discloses a heating system divided into two interconnected compartments, the first having at least one burner feeder and the second having at least one receiver burner.

U.S. Patent 6,739,125 to Mulligan discloses NO<sub>x</sub> emissions from an internal combustion engine fueled by a gaseous hydrocarbon fuel can be reduced by catalytically producing a hydrogen and carbon monoxide fuel gas stream from the gaseous hydrocarbon fuel and a portion of the hot exhaust gas from the internal combustion engine.

U.S. Patent 6,730,125 to Lin discloses a spinal fixation and retrieval device that comprises a retrieval main body, two side pieces, and a fastening device for fastening substantially symmetrically the two side pieces with two sides of the retrieval main body.

U.S. Patent 6,550,250 to Mikkelsen et al discloses a process and an apparatus for reducing the content of nitrogen oxides ( $\text{NO}_x$ ) in the exhaust gases of diesel engines or turbines for stationary or mobile applications/vehicles in an SCR system by providing a stored source of liquid reducing agent and feeding the stored reducing agent to the exhaust gases.

U.S. Patent 6,146,605 to Spokoyny discloses a system developed for delivering  $\text{NO}_x$  reduction agents from a common urea feedstock, when it is appropriate to use combined  $\text{NO}_x$  treatment stages.

U.S. Patent 6,566,300 to Park et al relates to a novel titania photocatalyst and its manufacturing method.

U.S. Patent 6,562,309 to Burke et al discloses a photocatalytic device for photocatalytically treating evaporative emissions that comprises a substrate with a photocatalyst.

U.S. Patent 5,236,672 to Nunez et al discloses an apparatus and method for controlling volatile organic compounds and air toxics in a contaminated fluid flow through use of an excited species flow generated and introduced into the contaminated fluid flow to convert the contaminants into non-toxic compounds.

U.S. Patent 4,448,176 to Hoppie discloses a method of reducing ignition delay  $\tau$ , of fuels to negligible values and negligible differences.

U.S. Patent 6,345,495 to Cummings discloses a gas turbine system for utilizing waste fuel gas that includes a combustor that provides combusted fuel to the expansion stage of the turbine.

U.S. Patent 5,876,195 to Early discloses a method for enhancing fuel ignition performance by preheating the fuel with laser light at a wavelength that is absorbable by the fuel prior to ignition with a second laser.

U.S. Patent 4,885,065 to Gilgenbach discloses a process for modifying or enhancing a combustion reaction by injecting a particle beam into the combustion reaction.

U.S. Patent 5,487,266 to Brown discloses combustion in a gas turbine controlled through use of flame spectroscopy in order to achieve low NO<sub>x</sub> emissions in the exhaust.

Copies of the above patents are enclosed. They are believed not to teach, suggest or otherwise render obvious the invention as disclosed or claimed herein.

Respectfully submitted,

\_\_\_\_\_  
William W. Haefliger
